Amendments to the Claims:

Please replace all prior versions, and listings of claims in the application with the following listing of claims.

Listing of claims

Claim 1 (currently amended): A method of determining a gain offset between transmission channels in a communication system, comprising the steps of:

deriving a first set of channel estimates from symbols received through a first channel;
deriving a second set of channel estimates from symbols received through a second channel; and
determining the gain offset based on the first and second sets of channel estimates, wherein each of the channel estimates is a model of one of the first and second channels, and includes one or more channel tap coefficients.

Claim 2 (original): The method of claim 1, wherein the first and second channels are pilot channels.

Claim 3 (currently amended): The method of claim 1, wherein the first and second channels are a Dedicated Physical Channel (DPCH) and a Common Physical Pilot Channel (CPICH), respectively, in a Wideband Code Division Multiple Access (WCDMA) system.

Claim 4 (currently amended): A method of determining a set of complex channel estimates for a transmission channel in a communication system, comprising the steps of:

deriving a first set of channel estimates from symbols received through the transmission channel;
deriving a second set of channel estimates from symbols received through a second channel in the communication system;
determining a gain offset based on the first and second sets of channel estimates; and
determining the set of complex channel estimates based on the gain offset and the first and second sets of channel estimates,

Application No.: 09/996,513

wherein:

each of the channel estimates in the first set of channel estimates is a model of the transmission channel, and includes one or more channel tap coefficients; and

each of the channel estimates in the second set of channel estimates is a model of the second channel, and includes one or more channel tap coefficients.

Claim 5 (original): The method of claim 4, wherein the gain offset is determined using a second-order equation.

Claim 6 (currently amended): ~~The method of claim 4,~~ A method of determining a set of complex channel estimates for a transmission channel in a communication system, comprising the steps of:

deriving a first set of channel estimates from symbols received through the transmission channel;

deriving a second set of channel estimates from symbols received through a second channel in the communication system;

determining a gain offset based on the first and second sets of channel estimates; and

determining the set of complex channel estimates based on the gain offset and the first and second sets of channel estimates,

wherein the gain offset g^{ML} is determined using the following equation:

$$g^{ML} = -\frac{\beta}{2} + \sqrt{\frac{\beta^2}{4} + \alpha},$$

where :

$$\beta = \frac{\sum_{i=1}^n \alpha \left(|\hat{h}_i^p|^2 - |\hat{h}_i^c|^2 \right)}{\sum_{i=1}^n \operatorname{Re} \left(\frac{\hat{h}_i^c \hat{h}_i^p}{\sigma_a^2} \right)}$$

α is a scale factor based on a spreading factor such that $\alpha = (sf / 256)(n_D / n_C)$, where sf is the spreading factor used for the symbols of the transmission channel, 256 is the spreading factor used for the symbols of the second channel, and n_D and n_C are, respectively, the numbers of symbols coherently summed to get the first set of channel estimates \hat{h}_i^D and the second set of channel estimates \hat{h}_i^C , and $\sigma_{e_i}^2$ is an estimated noise variance parameter.

Claim 7 (original): The method of claim 6, wherein the complex channel estimate h_i^{ML} is determined using the following equation:

$$h_i^{ML} = \frac{\alpha \hat{h}_i^D + g^{ML} \hat{h}_i^C}{\alpha + (g^{ML})^2}$$

where: α is a scale factor based on a spreading factor such that $\alpha = (sf / 256)(n_D / n_C)$, where sf is the spreading factor used for the symbols of the transmission channel, 256 is the spreading factor used for the symbols of the second channel, and n_D and n_C are, respectively, the numbers of symbols coherently summed to get the first set of channel estimates \hat{h}_i^D and the second set of channel estimates \hat{h}_i^C .

Claim 8 (original): The method of claim 6, wherein the complex channel estimate is determined by performing a linear combination of the first and second set of channel estimates based on the gain offset.

Claim 9 (currently amended): A method of determining a set of channel estimate gains for a transmission channel in a communication system, comprising the steps of:

- deriving a first set of channel estimates from symbols received through the transmission channel;
- deriving a second set of channel estimates from symbols received through a second channel in the communication system;
- determining a gain offset based on the first and second sets of channel estimates;

determining a set of channel estimate gains based on the gain offset and the first and second sets of channel estimates; and

associating the set of channel estimate gains with channel estimate phases of one of the first and second sets of channel estimates,

wherein:

each of the channel estimates in the first set of channel estimates is a model of the transmission channel, and includes one or more channel tap coefficients; and

each of the channel estimates in the second set of channel estimates is a model of the second channel, and includes one or more channel tap coefficients.

Claim 10 (original): The method of claim 9, wherein the associated channel estimate phase is the one of the first and second sets of channel estimates being from a high-power channel.

Claim 11 (currently amended): The method of claim 10, wherein the associated channel estimate phase is the one of the first and second sets of channel estimates being from a Dedicated Physical Channel (DPCH) channel in a Wideband Code Division Multiple Access (WCDMA) system.

Claim 12 (new): The method of claim 4, wherein the gain offset g^{ML} is determined using the following equation:

$$g^{ML} = -\frac{\beta}{2} + \sqrt{\frac{\beta^2}{4} + \alpha},$$

where :

$$\beta = \frac{\sum_{i=1}^n \alpha \left| \hat{h}_i^p \right|^2 - \left| \hat{h}_i^c \right|^2}{\sigma_d^2} \quad \sum_{i=1}^n \operatorname{Re} \left(\frac{\hat{h}_i^c \hat{h}_i^p}{\sigma_d^2} \right)$$

α is a scale factor based on a spreading factor such that $\alpha = (sf / 256)(n_D / n_C)$, where sf is the spreading factor used for the symbols of the transmission channel, 256 is the spreading factor used for the symbols of the second channel, and n_D and n_C are, respectively, the numbers of symbols coherently summed to get the first set of channel estimates \hat{h}_i^D and the second set of channel estimates \hat{h}_i^C , and σ_{ii}^2 is an estimated noise variance parameter.

Claim 13 (new): The method of claim 12, wherein the complex channel estimate h_i^{ML} is determined using the following equation:

$$h_i^{ML} = \frac{\alpha \hat{h}_i^D + g^{ML} \hat{h}_i^C}{\alpha + (g^{ML})^2}$$

where: α is a scale factor based on a spreading factor such that $\alpha = (sf / 256)(n_D / n_C)$, where sf is the spreading factor used for the symbols of the transmission channel, 256 is the spreading factor used for the symbols of the second channel, and n_D and n_C are, respectively, the numbers of symbols coherently summed to get the first set of channel estimates \hat{h}_i^D and the second set of channel estimates \hat{h}_i^C .

Claim 14 (new): The method of claim 12, wherein the complex channel estimate is determined by performing a linear combination of the first and second set of channel estimates based on the gain offset.
